Appendix A: Instrument Parameters

Resins

Gas Chromatography-Mass Spectrometry (GC-MS) Parameters	
GC parameters	
GC Column	Rtx-5 MS, 30 m x 0.25 mm ID x 0.25 µm
Carrier gas and Flow rate	H ₂ , 1.0 mL/min constant flow
Oven Temperature program	Initial temp: 80 °C, 2 min hold time Ramp 1: 10.0 °C /min to 315 °C, 15 min hold time
Inlet temperature	250 °C
Injection volume	1.0 µL
Inlet mode	200:1 Split
Total run time	40.5 min
MS parameters	
Mass filter	Quadrupole
Ionization	Electron ionization, 70 eV
Acquisition type	Scan
Solvent delay	2.0 min
MS source	230 °C
MS quad	150 °C
MS Transfer line	320 °C
Direct Analysis in Real Time Mass Spectrometry (DART-MS) Parameters	
Gas	Helium
Gas Temperature	300° C
DART and MS Polarity	Positive
Peaks Voltage	950 V
Mass Range	100 – 900 m/z
Headspace Gas Chromatography-Mass Spectrometry (HS-GC-MS) Parameters	
HS parameters	
Oven Temperature	75 °C
Loop Temperature	80 °C
Transfer Line Temperature	85 °C
Vial Equilibration	7 min
Injection Duration	0.5 min
GC parameters	
GC Column	Rtx-5 MS, 30 m x 0.25 mm ID x 0.25 µm
Carrier gas and Flow rate	H ₂ , 1.0 mL/min constant flow

Oven Temperature program	Initial temp: 50 °C, 5 min hold time Ramp 1: 10.0 °C /min to 280 °C, 0 min hold time Ramp 2: 30.0 °C /min to 315 °C, 1 min hold time
Inlet temperature	200 °C
Injection volume	1.0 µL
Inlet mode	5:1 Split
Total run time	30 min
MS parameters	
Mass filter	Quadrupole
Ionization	Electron ionization, 70 eV
Acquisition type	Scan
Solvent delay	0.5 min
MS source	230 °C
MS quad	150 °C
MS Transfer line	320 °C

3D Printed Products

Gas Chromatography-Mass Spectrometry (GC-MS) Parameters	
GC parameters	
GC Column	Rtx-5 MS, 30 m x 0.25 mm ID x 0.25 µm
Carrier gas and Flow rate	H ₂ , 1.0 mL/min constant flow
Oven Temperature program	Initial temp: 50 °C, 2 min hold time Ramp 1: 20.0 °C /min to 300 °C, 1 min hold time
Inlet temperature	250 °C
Injection volume	1.0 µL
Inlet mode	100:1 Split
Total run time	15.5 min
MS parameters	
Mass filter	Quadrupole
Ionization	Electron ionization, 70 eV
Acquisition type	Scan, mass range 35-500 m/z
Solvent delay	2.0 min
MS source	230 °C
MS quad	150 °C
MS Transfer line	320 °C

Pyrolysis Gas Chromatography/Mass Spectrometry (Pyr-GC-MS) Parameters	
GC parameters	
GC Column	Rtx-5 MS, 30 m x 0.25 mm ID x 0.25 µm
Carrier gas and Flow rate	H ₂ , 1.0 mL/min constant flow
Oven Temperature program	Initial temp: 50 °C, 2 min hold time Ramp 1: 8.0 °C /min to 310 °C, 10 min hold time

Inlet temperature	290 °C
Injection volume	1.0 µL
Inlet mode	100:1 Split
Total run time	45.5 min
MS parameters	
Mass filter	Quadrupole
Ionization	Electron ionization, 70 eV
Acquisition type	Scan, mass range 35-700 m/z
Solvent delay	0.0 min
MS source	230 °C
MS quad	150 °C
MS Transfer line	320 °C
Pyrolysis parameters	
Pyroprobe	600 °C, 20 s
Transfer line	300 °C
Interface	300 °C

Headspace Gas Chromatography-Mass Spectrometry (HS-GC-MS) Parameters	
HS parameters	
Oven Temperature	75 °C
Loop Temperature	80 °C
Transfer Line Temperature	85 °C
Vial Equilibration	7 min
Injection Duration	0.5 min
GC parameters	
GC Column	Rtx-5 MS, 30 m x 0.25 mm ID x 0.25 µm
Carrier gas and Flow rate	H ₂ , 1.0 mL/min constant flow
Oven Temperature program	Initial temp: 50 °C, 5 min hold time Ramp 1: 10.0 °C /min to 280 °C, 0 min hold time Ramp 2: 30.0 °C /min to 315 °C, 1 min hold time
Inlet temperature	200 °C
Injection volume	1.0 µL
Inlet mode	5:1 Split
Total run time	30 min
MS parameters	
Mass filter	Quadrupole
Ionization	Electron ionization, 70 eV
Acquisition type	Scan, mass range 35-500 m/z
Solvent delay	0.5 min
MS source	230 °C
MS quad	150 °C
MS Transfer line	320 °C

Appendix B: Chemical Data Tables¹

Resins

Gas Chromatography-Mass Spectrometry (GC-MS)

Qualitative analysis was performed using GC-MS (Agilent 5977MS/7890GC) to identify major components in each of the resins. Duplicate samples of each liquid resin were diluted (0.5 mL of resin in 4.5 mL dichloromethane) and analyzed on the GC-MS. In addition, chemical standards were purchased by LSC (based on a literature search of 3D resin ingredients) and analyzed on the GC-MS. Analysis of the chemical standards was used to confirm identification of major components in the resins by both retention time and mass spectrum match. The GC-MS instrument parameters for analysis can be found in [Appendix A](#).

Table B-1: GC-MS identification of resin components

Photopolymer Resin	GC-MS Analysis					
	Compound	CAS#	Compound	CAS#	Compound	CAS#
C1(Rigid Grey)	urethane dimethacrylate	72869-86-4	isophorone diisocyanate	4098-71-9	2-hydroxypropyl methacrylate	923-26-2
	2-hydroxyethyl methacrylate	868-77-9	ethylene dimethacrylate	97-90-5	Butylhydroxytoluene	128-37-0
C2 (Rigid White)	2-hydroxyethyl methacrylate	868-77-9	isophorone diisocyanate	4098-71-9	2-hydroxypropyl methacrylate	923-26-2
	3-hydroxypropyl methacrylate	2761-09-3	isobornyl methacrylate	7534-94-3		
C3 (Tough A Grey)	2-hydroxyethyl methacrylate	868-77-9	isophorone diisocyanate	4098-71-9	2-hydroxypropyl methacrylate	923-26-2
C4 (Tough B Grey)	2-hydroxyethyl methacrylate	868-77-9	isophorone diisocyanate	4098-71-9	2-hydroxypropyl methacrylate	923-26-2
	ethylene dimethacrylate	97-90-5				
C5 (Elastic Clear)	4-hydroxybutyl acrylate	2478-10-6	isophorone diisocyanate	4098-71-9		
C8 (Hi temp Clear)	2-hydroxyethyl methacrylate	868-77-9	isophorone diisocyanate	4098-71-9		
C9 (Light Grey)	2-hydroxyethylmethacrylate	868-77-9	isophorone diisocyanate	4098-71-9	ethylene dimethacrylate	97-90-5
	cyclohexyl methacrylate	101-43-9				
C15 (Dark Grey)	2-hydroxypropyl methacrylate	923-26-2	isophorone diisocyanate	4098-71-9	2-hydroxyethyl methacrylate	868-77-9

¹ The instruments and materials are identified in this report to specify the experimental procedure adequately. Such identification is not intended to imply recommendation or endorsement by the Consumer Product Safety Commission, nor is it intended to imply that the materials or equipment identified are necessarily the best available for the purpose.

Direct Analysis in Real Time Mass Spectrometry (DART-MS)

Qualitative analysis was performed using DART-MS (JEOL JMS-T100LC System) to identify major components in each of the resins and corroborate the results from the GC-MS analysis. Samples were analyzed using helium gas in both the positive and negative ionization mode along with chemical standards. The DART-MS instrument parameters for analysis can be found in **Appendix A**.

Table B-2: DART-MS identification of resin components

Photopolymer Resin	GC-MS Analysis					
	Compound	CAS#	Compound	CAS#	Compound	CAS#
D1 (Plant based Translucent green)	4-Acryloylmorpholine	5117-12-4	tri(propylene glycol) diacrylate	42978-66-5

Fourier-Transform Infrared Spectroscopy (FTIR)

Additional chemical content identification was performed using a FTIR Spectrometer (Thermo Nicolet 6700 FTIR) with Smart Orbit Diamond Attenuated Total Reflectance (ATR) accessory, DTGS KBr detector, resolution of 4 cm.⁻¹. Resin samples were tested neat. The FTIR spectrum for each resin tested was compared to spectra in the reference search library (HR Aldrich) for best match. In addition, a chemical standard library was built and used as a secondary search library by collecting the FTIR spectrum of the resin chemical standards.

Table B-3: FTIR identification of resins

Photopolymer Resin	FTIR Analysis	
	Compound	CAS#
C1(Rigid Grey)	Diurethane dimethacrylate, mixture of isomers	
C2 (Rigid White)	2-hydroethyl methacrylate, 97%	
C3 (Tough A Grey)	Diurethane dimethacrylate, mixture of isomers

F3 (Hi-Temp Yellow)	1,6-hexanediol diacrylate	13048-33-4

Flashpoint

Flashpoint analysis was performed using an Eraflash Automatic Flash Point Tester (Cannon Instruments). Flashpoint testing determines the lowest temperature a chemical can vaporize to form an ignitable mixture in air if an ignition source is provided. Duplicate samples of each liquid resin were tested following ASTM Method D7236-16a Standard

Test Method for Flash Point by Small Scale Closed Cup Tester (Ramp Method). Approximately 2 mL of resin was gradually heated to 212 °F and tested for ignition.

Inductively Coupled Plasma-Optical Emission Spectrometry (ICP-OES)

Quantitative elemental content in the resins was determined by microwave assisted acid digestion, followed by ICP-OES analysis (Agilent 5100). The method used was adapted from internal CPSC SOP-21-05-00: ICP-OES Elemental Analysis. Approximately 0.2 g of liquid resin was placed into a pre-cleaned Teflon digestion test tube along with 4 mL of trace metal grade nitric acid and 2 mL of trace metal grade hydrochloric acid. The vessels were capped and placed in a microwave (Milestone UltraWAVE). The samples were heated to 240 °C and digested for 10 min under pressure. Samples were cooled, diluted to a final volume of 30 mL, filtered through a 0.45 µm filter, and analyzed by ICP-OES. Duplicate samples of each liquid resin were digested and analyzed.

Note: Elements detected above the detection limit of 1 ppm are highlighted in yellow.

High Definition X-Ray Fluorescence (HDXRF)

Qualitative elemental content in the solidified resins was determined by curing the liquid resins in sunlight, followed by HDXRF (XOS HDPrime) analysis. Approximately 5-10 mL of each liquid resin was poured into borosilicate glass vials, placed in a covered rack, and set outside to harden in sunlight. HDXRF analysis was performed on each of the solidified resins to determine additional elemental content.

Note: Elements detected are highlighted in yellow.

Volatile Organic Compounds (VOCs) Analysis via Headspace GC-MS (HS-GC-MS)

Qualitative analysis was performed using HS-GC-MS (Agilent 7697HS/7890GC/5977MS) to target and identify VOC content in each of the resins. Duplicate samples of each liquid resin were diluted (1 mL of resin in 9 mL water) in a 20 mL headspace vial, sealed and analyzed on the HS-GC-MS. An EPA VOC mix standard (EPA 502/524.2 VOC Mix, Sigma Aldrich) containing VOC analytes (200 µg/mL each) was purchased and analyzed in conjunction with the resin samples. Ten milliliters of deionized water was added to a 20 mL headspace vial, sealed, and spiked with the VOC mix standards at a concentration of 1 µg/mL. Analysis of the VOC mix standard was used to confirm identification of VOCs in the resins by both retention time and mass spectrum match using a NIST MS library search. In addition, resin samples from each of the four brands (Brand 3, 4, 5 and 6) were spiked with the VOC mix standard at a concentration of 2 µg/mL and analyzed via HS-GC-MS. Detailed HS-GC-MS instrument parameters for analysis can be found in **Appendix A**. Samples were analyzed at a temperature of 75 °C to maximize the release of any potential VOC's. Typically, vat polymerization 3D printers operate at room temperature.

Note: VOCs detected are highlighted in yellow.

3D Printed Products

Gas Chromatography-Mass Spectrometry (GC-MS)

Qualitative analysis was performed using GC-MS (Agilent 5977MS/7890GC) to identify extractable components in each of the printed products. Extractable testing was performed on each of the 3D printed products produced from the five different printer manufacturers: Printer A, Printer B, Printer C, Printer D, and Printer E. Extraction was accomplished by adding approximately 0.5 g of printed material to an appropriate extraction vial with 5 mL of isopropyl alcohol (IPA) and placed in a sonicator at room temperature for 30 minutes followed by analysis using the GC-MS. Identification of extractable components was confirmed by mass spectrum match using a NIST MS library search. The GC-MS instrument parameters for analysis can be found in **Appendix A**.

E14 blue	Not identified*				

*Not identified- no peaks above baseline were able to be identified with a NIST hit >30%.

Note: A library match (in percent) is given for each compound, indicating how consistent the unknown samples compare to known standards. For certain compounds, the library match was found to be too low, and therefore, misleading. The identifications from the NIST library are only intended as a guide and should be used as a basis for decision of whether additional verification of the compounds against relevant reference standards should be carried out.

Pyrolysis Gas Chromatography/Mass Spectrometry (Pyr-GC–MS)

Qualitative analysis was performed using Pyr-GC–MS (CDS Pyroprobe 6200 Pyrolyzer, Agilent 5977MS/7890GC) to identify the thermal composition of the printed materials. Pyr-GC–MS was used to characterize the polymer matrices of multiple 3D printed products produced from the five different printer manufacturers: Printer A, Printer B, Printer C, Printer D, and Printer E. A small piece was cut from the 3D printed material and analyzed neat (“as is”) using the pyrolyzer, followed by analysis using the GC-MS. The pyrolyzates (smaller molecules), derived from the decomposition of the printed material, were identified by mass spectrum using a NIST MS library. The Pyr-GC–MS instrument parameters for analysis are found in **Appendix A**.

Table B-22: Pyr-GC-MS polymer identification of 3D printed materials (solid filaments)

Solid Filament	Pyr-GC–MS Analysis					
	Compound	CAS#	Compound	CAS#	Compound	CAS#
Printer A PLA material (Various colors)	Acetaldehyde	75-07-0	Acetic acid	64-19-7	2,3-pentanedione	600-14-6

Headspace GC-MS (HS-GC-MS)

Qualitative analysis was performed using HS-GC-MS (Agilent 7697HS/7890GC/5977MS) to identify VOC content emitted from the 3D printed products. A sample of each printed material was tested neat (“as is”) and a sample of each was tested in water (0.5 g of material in 10 mL water). In both cases, a 20 mL headspace vial was used, sealed, and analyzed on the HS-GC-MS. The HS-GC-MS instrument parameters for analysis are found in **Appendix A**.

Inductively Coupled Plasma-Optical Emission Spectrometry (ICP-OES)

Quantitative elemental content in the 3D printed products was determined by microwave assisted acid digestion, followed by ICP-OES analysis (Agilent 5100). The method used was adapted from internal CPSC SOP-21-05-00: ICP-OES Elemental Analysis. Approximately 0.2 g of printed material was placed into a pre-cleaned Teflon digestion test tube along with 4 mL of trace metal grade nitric acid and 2 mL of trace metal grade hydrochloric acid. The vessels were capped and placed in a microwave (Milestone UltraWAVE). The samples were heated to 240 °C and digested for 10 minutes under pressure. Samples were cooled, diluted to a final volume of 30 mL, filtered through a 0.45 µm filter, and analyzed by ICP-OES. Duplicate samples of each 3D printed product were digested and analyzed.

Note: Elements detected above the detection limit of 1 ppm are highlighted in yellow.

High-Definition X-Ray Fluorescence (HDXRF)

Qualitative surface elemental content in the 3D printed products was determined by HDXRF (XOS HDPrime) analysis. HDXRF analysis was performed on each of the printed materials to determine elemental content and corroborate the results from the ICP-OES analysis.

Note: Elements detected are highlighted in yellow

Fourier-Transform Infrared Spectroscopy (FTIR)

Additional chemical content identification was performed using a FTIR Spectrometer (Thermo Nicolet 6700 FTIR) with Smart Orbit Diamond Attenuated Total Reflectance (ATR) accessory, DTGS KBr detector, resolution of 4 cm⁻¹. 3D printed materials were tested neat. The FTIR spectrum for each printed material tested was compared to spectra in the reference search library (HR Aldrich) for best match.
